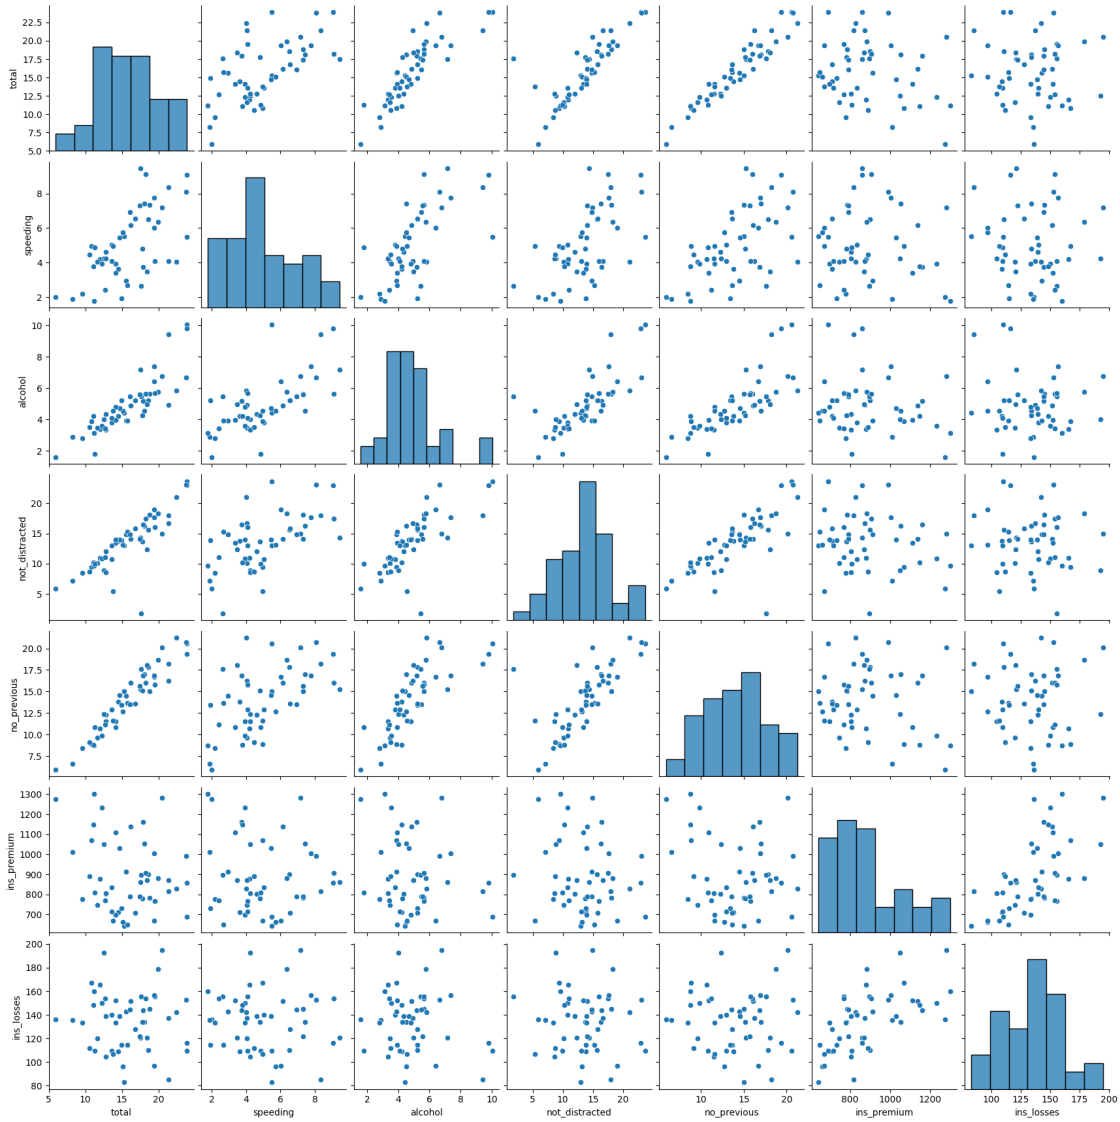
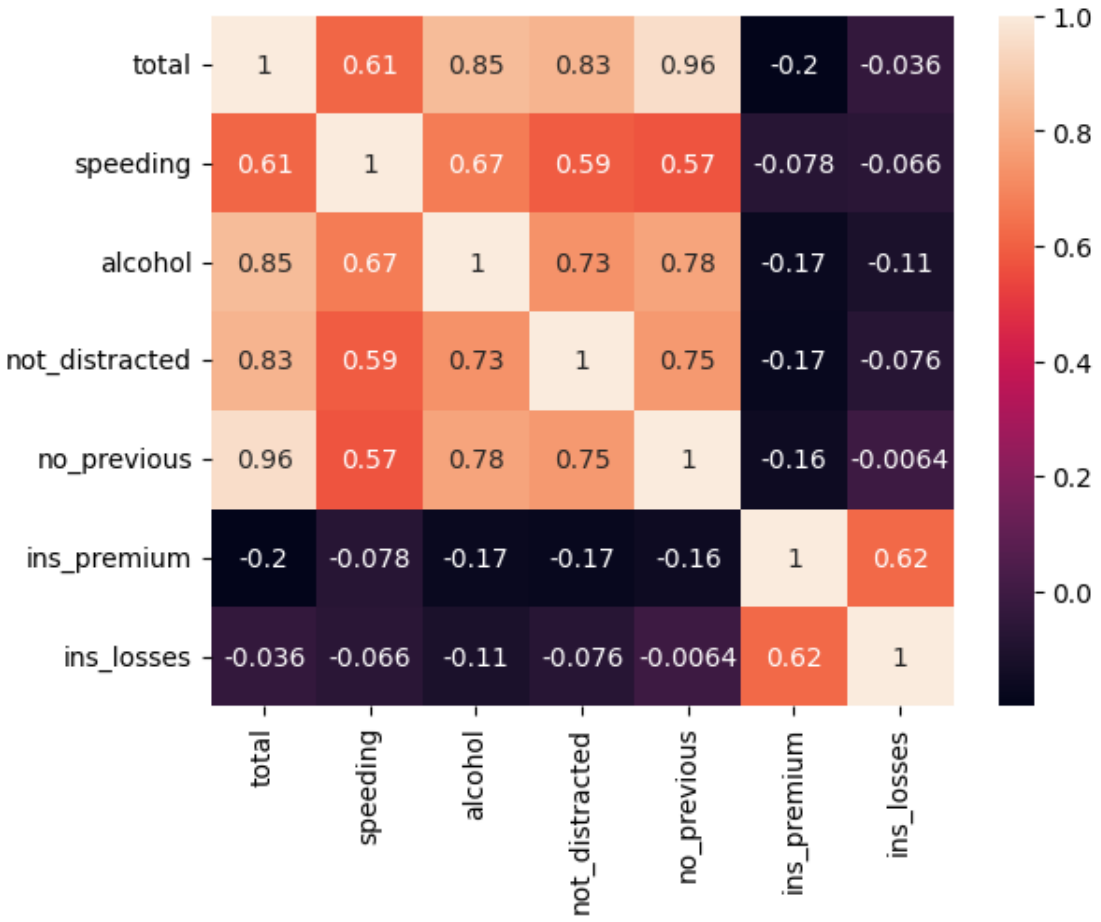
[6]:
```
import matplotlib.pyplot as plt
sns.pairplot(crashes)
plt.show()
```



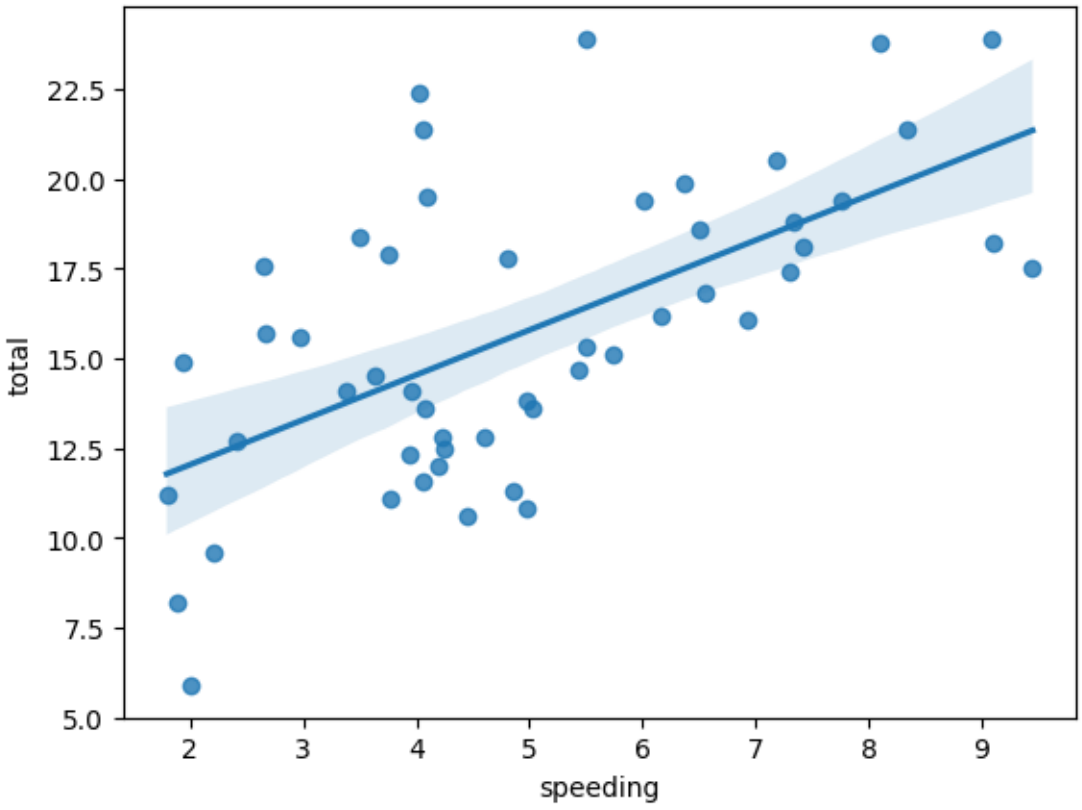
Inference: The pairplot allows us to visualize the relationships between all numeric variables in the dataset.We can see scatter plots for the numeric variables and histograms for the individual variables along the diagonal. It's useful for identifying potential correlations and distributions.

[8]:
```
correlation = crashes.corr(numeric_only=True)
sns.heatmap(correlation, annot=True)
plt.show()
```



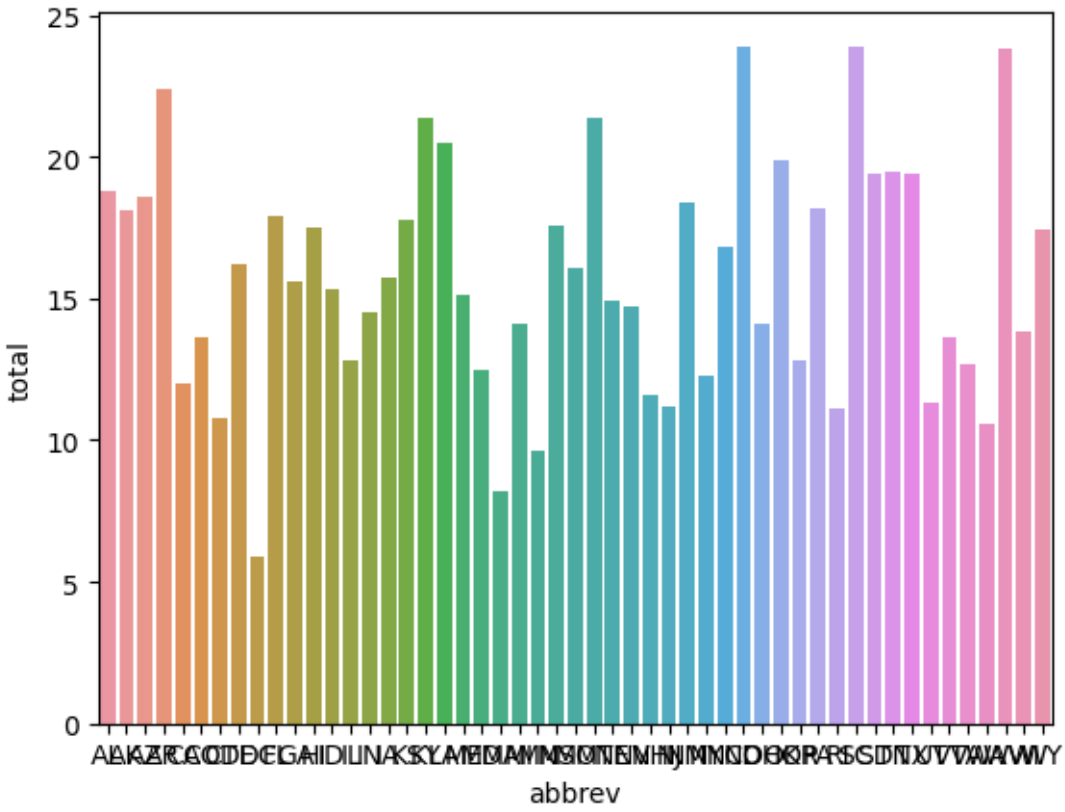
Inference: The heatmap shows the correlation between numeric variables. A value close to 1 indicates a strong positive correlation, while a value close to -1 indicates a strong negative correlation. This helps us understand which variables are most strongly related.

[9]:
```
sns.regplot(x='speeding', y='total', data=crashes)
plt.show()
```



Inference: This regression plot shows the relationship between speeding and total number of crashes. It also includes a regression line which helps us understand the trend.

[10]:
```
sns.barplot(x='abbrev', y='total', data=crashes)
plt.show()
```



Inference: This bar plot shows the total number of crashes for each state. It allows us to compare the crash counts between different states
